EFFORTLESS

POWER SYSTEM STUDIES

SHORT CIRCUIT STUDY

Compares equipment withstand ratings against generated fault current values.

VOLTAGE DROP STUDY

Identifies the percent of voltage drop to prevent damage to equipment and reduce wasted energy.

COORDINATION STUDY

Generates protective device settings to limit faults locally and provide optimal equipment protection.

MOTOR STARTING

Evaluates large motors in a system to confirm they have adequate voltage during startup.

ARC FLASH ANALYSIS

Determines available incident energy to ensure adequate PPE protection for workers.

HARMONIC ANALYSIS

Identifies harmonics to minimize potential damage to equipment and help implement corrective action.

LOAD FLOW STUDY

Identifies overloaded and under-utilized equipment to recommend adequate sizing.
